

# SFP/SFD I<sup>2</sup>C Interface Programming Manual

## 1 Scope

This document describes in detail the I<sup>2</sup>C communication interface of the SFP/SFD series. (SFP450-12BG, SFP650-12BG, SFD550-12BG) This includes the physical layer and the SW protocol.

## 2 SFP/SFD I<sup>2</sup>C Interface General Characteristic

SFP/SFD I <sup>2</sup> C interface	slave
I <sup>2</sup> C Device Addressing Format	7bit
Device Address Range	AC <sub>Hex</sub> ...AF <sub>Hex</sub> , 7F <sub>Hex</sub> , 7D <sub>Hex</sub>
Max. SFP/SFD on one I <sup>2</sup> C Bus	2
Maximum I <sup>2</sup> C clock	100kHz
Maximum I <sup>2</sup> C clock without holding the SCL line down	Serial EEPROM: 100kHz Status Port: 6.5kHz
Pull-Up Voltage	3.3...4V
SDA/SCL internal series resistors	100Ω
Internal Pull-Up	10kΩ
Internal Pull-Up voltage	3.3V
Internal capacitance	140pF
Internal Pull-Up Address lines	3.2kΩ
Internal Pull-Up Address lines voltage	3V
Internal Pull-Up Write Protect	4.7kΩ
Recommended external Pull-Up for SDA and SCL	1.2kΩ ...2kΩ
Data Organization	-Serial EEPROM (256 x 8bit) -Status Port with commands

## 4 SFP/SFD I<sup>2</sup>C features

### 4.1 Dynamic data

The SFP/SFD series supports following monitoring features:

- Measured Output 1 voltage [V]
- Measured Output 1 current [A]
- Power Supply seated/not seated
- Input Voltage in range/out of range
- All Output Voltage in range/out of range
- Output 1 over current occurred true/false
- Output 1 and 2 under voltage occurred true/false
- Output 1 over voltage occurred true/false
- Fan OK/failure
- Over Temperature true/false

### 4.2 Static data

In the EEPROM are following static data stored:

- Power Supply Model
- Serial Number
- Power-One Revision
- MFG Year
- MFG Month
- MFG Day
- MFG Name
- MFG Location Code
- Specified Output 1 Voltage
- Specified Output 2 Voltage
- Specified Output 1 Current
- Specified Output 2 Current
- Specified Output Power
- Minimum Specified Input Voltage
- Maximum Specified Input Voltage
- 22 Bytes in EEPROM for Customer use
- Spec Number
- Sequential Nr
- Checksum over static range

## 5 General I<sup>2</sup>C HW configuration

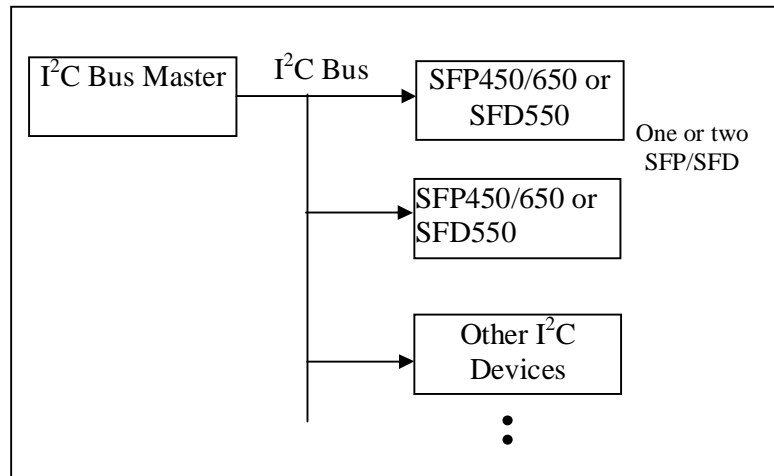

Figure 5-1 System Overview

### 5.1 Connecting the SFP/SFD to the I<sup>2</sup>C Bus

The following diagram shows how the SFP/SFD can be connected to the I<sup>2</sup>C Bus.

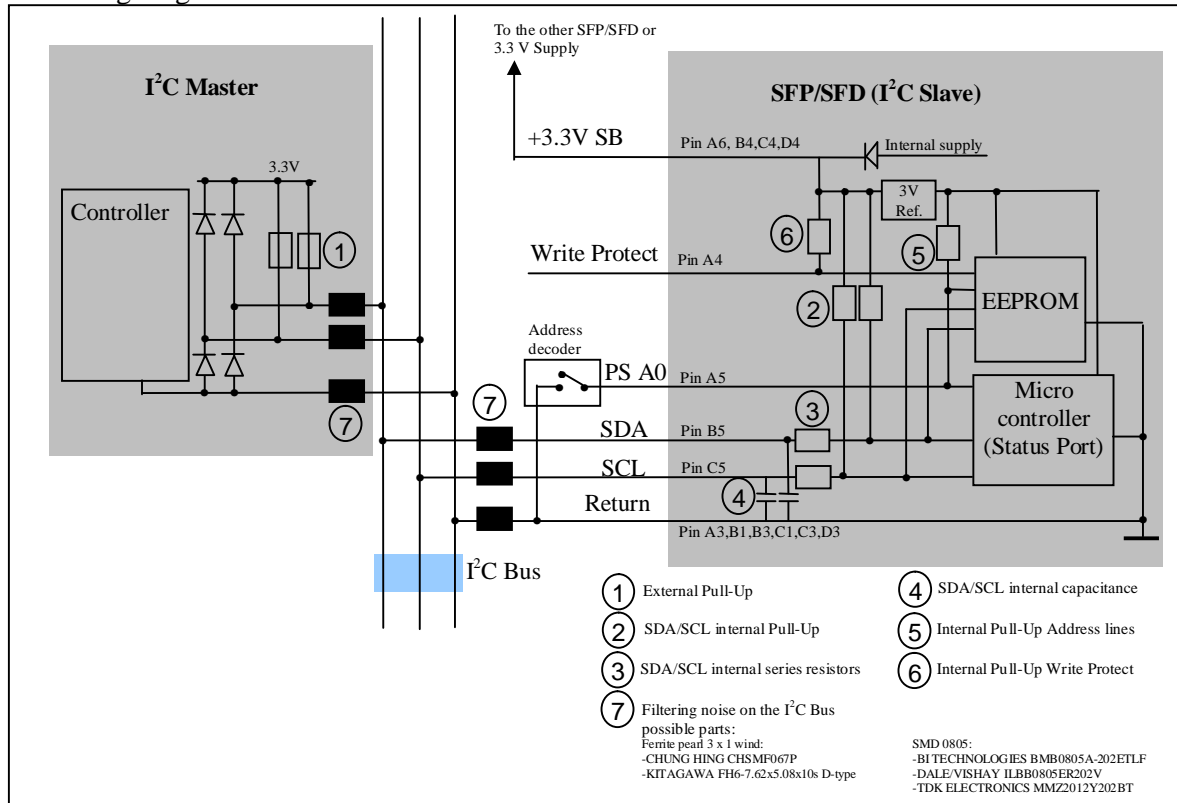

Figure 5-2 Recommended connecting of the SFP/SFD to the I<sup>2</sup>C Bus

## 5.2 SFP/SFD I<sup>2</sup>C Supply (Slave)

The SFP/SFD Micro Controller/EEPROM is powered over the internal supply of the SFP/SFD. For redundancy in case of DC failure or SFP/SFD internal failure the SFP/SFD Micro Controller/EEPROM can be powered over the “+3.3VSB” (Pin A6, B4, C4, D4 ;3.3V). If there is no power for the SFP/SFD Micro Controller the entire I<sup>2</sup>C Bus is blocked.

## 5.3 Device Address

The first byte after the START condition on the Bus is the device address sent out by the Bus Master to determine which device is being selected. The I<sup>2</sup>C Bus allows 7-bit or 10-bit addressing. The SFP/SFD Interface uses a 7-bit address mode as defined in the Philips I<sup>2</sup>C specification. The SFP/SFD contains an EEPROM and a STATUS (microcontroller) device and each device on the I<sup>2</sup>C Bus has to be assigned to a unique address.

As shown below in Figure 5-3 Device Address the address byte is built up from three parts:

- Bit 2...7: These bits are always the same independent of any address line.
- Bit 1: This bit depends how the Address line A0 is connected on the backplane on the address decoder. These are logic 1 if open and logic 0 if wired to 0V (Return).
- Bit 0: This bit is the read/write bit (R=1/W=0) and determines the direction of the data from or to the Master.

		Device Hardware Address						Software Address Bit	
		MSB						LSB	
Bit		7	6	5	4	3	2	1	0
SFP/SFD EEPROM Device Address	Determined via	Fixed Per Device						addr. line	Read/Write Direction
	Address Value	1	0	1	0	1	1	PS A0	1 or 0
SFP/SFD STATUS Device Address	Determined via	Fixed Per Device						addr. line	Read/Write Direction
	Address Value	0	1	1	1	1	1	PS A0	1 or 0

Figure 5-3 Device Address

	Address Line PS A0	Read/Write	Device Address [Bin]	Device Address [Hex]	Device Address [Dec]
SFP/SFD EEPROM Device address	open	read	1010'1111	AF	175
SFP/SFD EEPROM Device address	open	write	1010'1110	AE	174
SFP/SFD STATUS Device address	open	read	0111'1111	7F	127
SFP/SFD EEPROM Device address	0V	read	1010'1101	AD	173
SFP/SFD EEPROM Device address	0V	write	1010'1100	AC	172
SFP/SFD STATUS Device address	0V	read	0111'1101	7D	125

Figure 5-4 Device Address Table

Example: On the backplane PS A0 is connected to 0V, you will have the following device address to read a byte from the SFP/SFD EEPROM:

	MSB							LSB
Bit	7	6	5	4	3	2	1	0
SFP/SFD EEPROM Device Address	1	0	1	0	1	1	0	1
	fixed	fixed	fixed	fixed	fixed	fixed	A0	R
->1010'1101 <sub>Bin</sub> =AD <sub>Hex</sub> =173 <sub>Dec</sub>								

**Figure 5-5 Device Address Example**

## 5.4 I<sup>2</sup>C Bus Master and clock (SCL) speed

The I<sup>2</sup>C Bus Master controls communications between the Master and all I<sup>2</sup>C devices connected to the bus. If during an I<sup>2</sup>C communication cycle the SFP/SFD Status Port is interrupted by an internal service interrupt, the SFP/SFD will hold the SCL line low to force the master into a wait state. Data transfer will continue when the SFP/SFD releases the SCL line. Please note if the I<sup>2</sup>C bus is communicating with a clock frequency slower than 6.5kHz, the SCL line will not be held low. The SFP/SFD EEPROM is an ATMEL AT24C02 compatible device and is not holding down the SCL line.

## 5.5 Maximum and minimum values for Pull-Up resistors

For I<sup>2</sup>C-bus systems, the values of the Pull-Up resistors depend on the following parameters:

- Supply voltage
- Bus capacitance
- Number of connected devices (input current + leakage current).

The supply voltage limits the minimum value of the Pull-Up resistor due to the specified minimum sink current of 3mA. On a 3.3V supply, this makes  **$R_{min}=3.3V/3mA=1.1k\Omega$** .

The bus capacitance is the total capacitance of wire, connections and pins. This capacitance limits the maximum value of the Pull-Up resistor due to the specified rise time. For a System with 380pF capacitance (two SFP/SFD and a wire capacitance of 100pf)  **$R_{max}=2.1k\Omega$** .

For further information concerning the Pull-Up resistor, refer to:

I<sup>2</sup>C Bus specification, 16.1 Maximum and minimum values of resistors R<sub>p</sub> and R<sub>s</sub> for Standard-mode I<sup>2</sup>C-bus devices.

## 6 SW Protocol

The static data are stored in a serial I<sup>2</sup>C EEPROM and the dynamic data can be requested over the Status Port with three commands.

### 6.1 Static serial EEPROM data

Therefore each EEPROM address has defined data; this definition is documented in chapter 8 EEPROM Definitions:

Address	Dec		Hex
	0	static data	0
	1	static data	1
	251	static data	FB
	252	checksum	FC
	253	checksum	FD
	254	checksum	FE
	255	checksum	FF

**Figure 6-1: Data Organization**

There are three different message formats for the SFP/SFD Serial EEPROM:

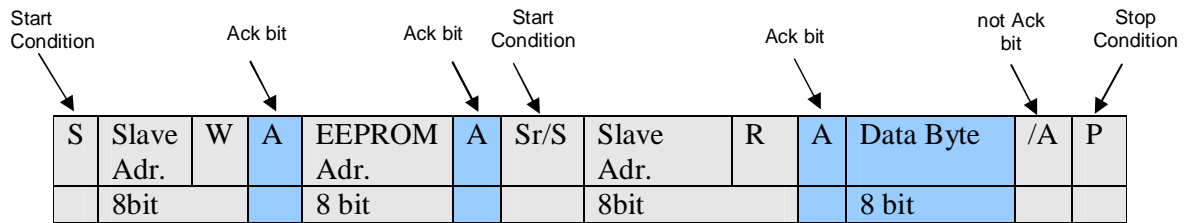

- Read an EEPROM byte
- Read an EEPROM block
- Write an EEPROM byte

## 6.2 Dynamic Status Port Data

The I<sup>2</sup>C Master can read from the status port the status of the PS, the measured voltage and current. Three commands exist:

0x01: read status byte

0x02: read measured voltage

0x03: read measured current

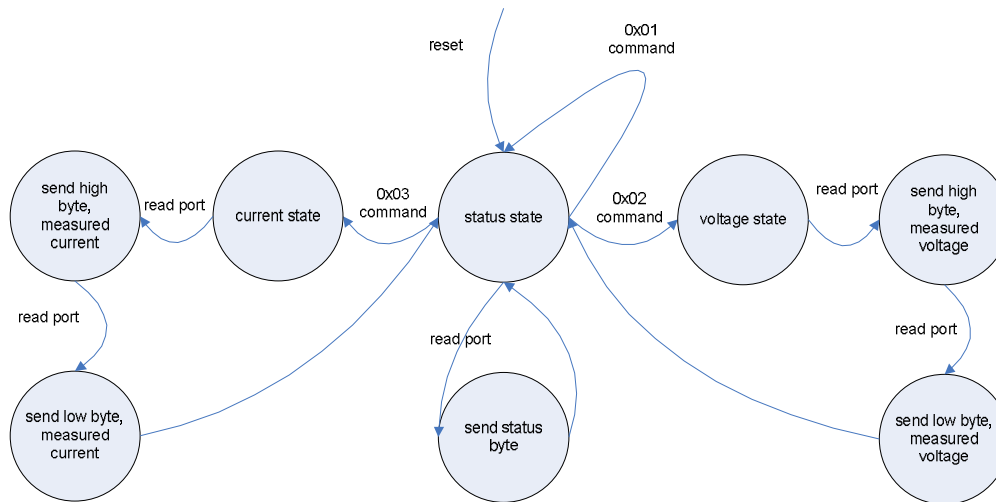

Figure 6-2 Software states for the Status port

## 6.2.1 Status Byte definition

			Explanation
Bit 0	PS present = 0 (True)	False = 1	This Signal indicates that the PS is present.
Bit 1	PW OK = 1 (PS OK)	Fault = 0	Output Power Good, signalized that all outputs are valid.
Bit 2	AC OK = 0 (OK)	Fault = 1	AC in specified range.
Bit 3	OC +12V = 1 (PS OK)	Fault = 0	+12 V Over Current goes low when it exceeds the current rating. The output will be latched.*
Bit 4	UV+12V,UV+3V3SBY = 1 (PS OK)	Fault = 0	+12V Under Voltage goes low, when +12V dips under the specified voltage and shuts down the Unit. The Output will be latched.* Or the 3.3VSBY has an Under Voltage.
Bit 5	OV +12V = 1 (PS OK)	Fault = 0	+12V Over Voltage goes low, when +12V trips over the specified voltage and shuts down the unit. The Output will be latched. *
Bit 6	ALERT = 1 (PS OK)	Fault = 0	The Alert signal goes low, if one of the fans falls below a threshold speed value or an OTP occurs.
Bit 7	OTP = 1(PS OK)	Fault=0	The Over Temperature Protection circuit has shut down the unit.

Figure 6-3 Table for status information

\*Latched states can only be cleared by recycling AC mains or toggling PS\_ON.

## 6.2.2 Voltage/current data interpretation

The voltage and current monitor can be accessed with the commands 0x02 and 0x03. The values are returned in an unsigned 10bit number which is left justified.

Resolutions:

Unit	Voltage	Current
SFP450	20 mV/bit	50 mA/bit
SFD550	19.8 mV/bit	73.3 mA/bit
SFP650	20mV/bit	100mA/bit

Example of a voltage measuring:

Bit 7							Bit 0	Bit 7							Bit 0
1	0	0	1	0	1	1	0	0	0	x	x	x			x
First byte 1								Second byte							
This gives the value: 10'0101'1000 <sub>BIN</sub> =258 <sub>HEX</sub> =600 <sub>DEC</sub>															
The measured voltage is 600 <sub>DEC</sub> *20mV/bit= <b>12000 mV</b>

### 6.2.3 How to read the status byte from Status Port

To read the status byte, is like reading from a serial EEPROM at address 0x01.

- 1) "Start condition" from Master
- 2) Master sends "Status Port Device address" with "write attribute"
- 3) "Acknowledge" from Slave device (SFP/SFD Status Port)
- 4) Master sends "Status Port command address 01"
- 5) "Acknowledge" from Slave device (SFP/SFD Status Port)
- 6) "Repeated start" from Master (Sr/S)
- 7) Master sends "Status Port device address" with "read attribute"
- 8) "Acknowledge" from Slave device (SFP/SFD Status Port)
- 9) Slave sends "Status byte"
- 10) "Not Acknowledge" from Master (power management system)
- 11) "Stop condition" from Master

## 6.2.4 How to read the measured output Voltage/Current

- 1) "Start condition" from Master
- 2) Master sends "Status Port Device address" with "write attribute"
- 3) "Acknowledge" from Slave device (SFP/SFD Status Port)
- 4) Master sends "Command 02 (Voltage) or 03(Current)"
- 5) "Acknowledge" from Slave device (SFP/SFD Status Port)
- 6) "Repeated start" from Master (Sr/S)
- 7) Master sends "Status Port Device address" with "read attribute"
- 8) "Acknowledge" from Slave device (SFP/SFD Status Port)
- 9) Slave sends "first data Byte"
- 8) "Acknowledge" from Master (power management system)
- 9) Slave sends "second data Byte"
- 10) "Not Acknowledge" from Master (power management system)
- 11) "Stop condition" from Master

**Figure 7-2 HZZ02002G to SFP/SFD cable**

The HZZ02002G has the Pull-Up resistors connected to 5V and 3.3V compatible inputs. The SFP/SFD has an internal clamp circuit to 4V. Connect “SDA”(pin B5), “SCL”(pin C5) and “Return” (pin A3,B1,B3,C1,C3,D3) to the I<sup>2</sup>C to USB converter. Connect “PSON/L” to “Return” to enable the SFP/SFD and plug the SFP/SFD to the mains.

The I<sup>2</sup>C EEPROM device address: 175<sub>Dec</sub> (read)

The I<sup>2</sup>C Status Port device address: 127<sub>Dec</sub> (read).

In your final application the I<sup>2</sup>C master will be a Micro Computer or an FPGA with an I<sup>2</sup>C interface. That makes it easy and inexpensive to use the interface.

## 11 Glossary

μC	Micro Controller
Bin	Value in binary number system
Dec	Value in decimal number system
EEPROM	Electrically Erasable Programmable Read Only Memory
Hex	Value in hexadecimal number system
I <sup>2</sup> C Bus	Inter-Integrated Circuit Bus
kHz	kilohertz
LSB	Least significant bit
MFG	Manufacturing
MSB	Most significant bit
pF	picofarad
SCL	serial clock line
SDA	serial data line
